## Abstract

Energy levels, radiative transition probabilities, and autoionization rates for B-like oxygen ( $O^{3+}$ ) including  $1s^22s^2nl$ ,  $1s^22s2pnl$ , and  $1s^22p^2nl$  ( $n=2-8$ ,  $l \leq n - 1$ ) states were calculated by multi-configurational Hartree-Fock method (Cowan code) and relativistic many-body perturbation theory method (RMBPT code). Autoionizing levels above three thresholds ( $1s^22s^2\ ^1S$ ,  $1s^22s2p\ ^3P$ ,  $1s^22s2p\ ^1P$ ) were considered. Configuration mixing ( $2s^2nl + 2p^2nl$ ) plays an important role for all atomic characteristics. Branching ratios relative to the first threshold and intensity factor were calculated for satellites lines and dielectronic recombination rate coefficients for the excited 105 odd-parity and 94 even-parity states. The dielectronic recombination rate coefficients were calculated including  $1s^22s^2nl$ ,  $1s^22s2pnl$ , and  $1s^22p^2nl$  ( $n=2-8$ ,  $l \leq n - 1$ ) states. The contribution from the excited states higher than  $n=8$  were estimated by extrapolation of all atomic characteristics to derive the total dielectronic recombination rate coefficient. The orbital angular momentum quantum number  $l$  distribution of the rate coefficients shows a peak at  $l=5$ . The total dielectronic recombination rate coefficient was derived as a function of electron temperature. The dielectronic satellite lines were also obtained. The state selective dielectronic recombination rate coefficients to excited states of B-like oxygen were obtained, which are useful for modeling O IV spectral lines in a recombining plasma.

**Key words:** boronlike oxygen, dielectronic recombination rate coefficients, energy levels, radiative transition probabilities, autoionization rates, excited states, dielectronic satellite lines

## I. INTRODUCTION

Dielectronic recombination (DR) is an important recombination process in high temperature plasma generally, and radiative recombination is important at low electron temperature.

In series papers of Nussbaumer and Storey [1–4] the total and effective DR rate coefficients were calculated for ions of C, N, O and Ne. Energies and radiative transition probabilities between these states were calculated in [1] by SUPERSTRUCTURE code. The accuracy of their data is estimated not so high to identify spectral features [2, 3]. For the autoionization rate, collision strengths obtained by the distorted wave approximation were used. Total DR rate coefficients were given in [2] for ions  $C^+$ ,  $C^{2+}$ ,  $C^{3+}$ ,  $N^{3+}$ ,  $N^{4+}$ ,  $O^{2+}$ ,  $O^{3+}$ ,  $O^{4+}$ , and  $O^{5+}$ . Their results were fitted in analytical formula in the range of  $T=10^3$  K -  $6\times10^4$  K. Effective DR rate coefficients were calculated in [2] for selected lines and to the ground and metastable states of ions  $C^+$ ,  $C^{2+}$ ,  $C^{3+}$ ,  $N^{3+}$ ,  $N^{4+}$ ,  $O^{2+}$ ,  $O^{3+}$ ,  $O^{4+}$ , and  $O^{5+}$ . Their data were also fitted in the range  $T=10^3$  K -  $6\times10^4$  K. The same method was used in [3] for calculation of effective DR rate coefficients for selected lines and ground and metastable states of ions  $Ne^{2+}$ ,  $Ne^{3+}$ ,  $Ne^{4+}$ ,  $Ne^{5+}$ , and  $Ne^{6+}$ .

In series papers of Badnell [5–8] and Badnell and Pindzola [9] it was studied the influence of core fine-structure interaction on dielectronic recombination at low temperatures for the same ions as by Nussbaumer and Storey [1–4] and also the dielectronic rate coefficient were computed for Be-like ions with  $Z=6-42$ . The code SUPERSTRUCTURE which was used in [1–4] was used only for the radiative transition probabilities. From this code the code AUTOSTRUCTURE was developed by Badnell [5–9] to calculate autoionization rates including configuration-mixing LS-coupling or intermediate - coupling. In the paper by Badnell [7], the detailed comparison were given for B-like C, N and O ions with data obtained by Nussbaumer and Storey [3]. The effective DR rate coefficients for lines agree within 10–20% with those of Nussbaumer and Storey [3] except some lines. The disagreement for these lines (factor 6) was explained in [7] by different values of autoionization rates used in [3] and [7].

Recently, DR rate coefficients to excited states of C II from C III ions were evaluated in Refs. [10, 11]. It was recalculated data for B-like C (CII from CIII) obtained by Nussbaumer and Storey [3] and Badnell [8]. It was used Cowan code [12] which gives more accurate data for energy than SUPERSTRUCTURE code used in [3] and [8] and, probably, the same data

for autoionization rates as AUTOSTRUCTURE code [8] (results for autoionization rates were not compared since their data were not given in [3] and [8]). Except consideration all configurations up to  $n=6$  in [11], contribution from configurations with  $6 < n < 500$  was taken into account. The importance of the contributions of highly excited state for DR rate coefficients was underlined by Hahn [13]. Since the DR rate coefficient to each excited state like  $\alpha_d(1s^22s^2nl(LS))$  are not given in Refs. [3, 8], new data for  $\alpha_d(1s^22s^2nl(LS))$  were presented in [11]. Similar method was used recently to evaluate DR rate coefficients for the excited states of C I ([14]) and Be-like carbon ([15]), neon ([16]), and oxygen ([17]).

In the present paper, energy levels, radiative transition probabilities, and autoionization rates for B-like oxygen ( $O^{3+}$ ) with taken into account 52 even- and 50 odd-parity configurations including  $1s^22s^2nl$ ,  $1s^22s2pnl$ , and  $1s^22p^2nl$  ( $n=2-8$ ,  $l \leq n - 1$ ) states were calculated by multi-configurational Hartree-Fock method (Cowan code) and relativistic many-body perturbation theory method (RMBPT code). We presented detailed comparison our theoretical calculations with recommended National Institute of Standards and Technology (NIST) data to be sure in accuracy of our results. Autoionizing levels above three thresholds ( $1s^22s^2\ ^1S$ ,  $1s^22s2p\ ^3P$ ,  $1s^22s2p\ ^1P$ ) were considered. Branching ratios relative to the first threshold and intensity factor were calculated for satellites lines and DR rate coefficients for the excited 105 odd-parity and 94 even-parity states. The DR rate coefficients were calculated including  $1s^22s^2nl$ ,  $1s^22s2pnl$ , and  $1s^22p^2nl$  ( $n=2-8$ ,  $l \leq n - 1$ ) states. The contribution from the excited states higher than  $n=8$  were estimated by extrapolation of all atomic characteristics to derive the total DR rate coefficient. The total DR rate coefficient was derived as a function of electron temperature. The dielectronic satellite lines were also obtained.

## II. ENERGY LEVELS, TRANSITION PROBABILITIES, AND AUTOIONIZATION RATE

We carried out detailed calculations of the radiative and autoionization rates for the intermediate states  $1s^22s^2(^1S)nl$ ,  $1s^22s2p(^{1,3}P)nl$ , and  $1s^22p^2(^3P, ^1D, ^1S)nl$  with  $n=2-8$ ,  $l \leq n - 1$  (see Table I. Resulting list of levels consists from the 652 odd-parity and 710 odd-parity states. The atomic energy levels, radiative transition probabilities and autoionization rates were obtained by using the atomic structure code of Cowan [12]. It was found (see for example Pindzola et al [18]) that using this code, one could obtain good agreement

with experimental energies by scaling the electrostatic Slater parameters using the different factor (0.80 in [18] and 0.85 in our case) to correct for correlation effects. It should be noted that we used improved version of Cowan code freely distributed by Dr. A. Kramida via the Internet [19]. That version of computer code allowed to remove transitions with small values of transition rates  $A_r$  up to  $A_r < 10^5 \text{ s}^{-1}$ . Even with those limitation the resulting list of radiative transitions between the  $1s^2 2s^2 nl$ ,  $1s^2 2s 2p nl$ , and  $1s^2 2p^2 nl$  ( $n=2-8$ ,  $l \leq n-1$ ) states consists from the 12882 even-odd parity transitions and 15805 odd-even parity transitions.

The relativistic many-body perturbation theory method (RMBPT code) was also used for calculating energy and radiative transition probabilities. This method was described in detail in Refs. [20–22]. The results of our calculations are given in Tables II–V, and VIII.

In Table II, we give energies for the  $2s^2 2p^2 P_J$ ,  $2s 2p^2 2^4 L_J$ ,  $2p^3 2^4 L_J$ ,  $2s^2 3l^2 l_J$ ,  $2s 2p 3l^2 4L_J$ , and  $2p^2 3l^2 4L_J$  levels of  $O^{3+}$  ion. Theoretical results for energies obtained from the two codes, Cowan (columns 3 and 8) and RMBPT (columns 4 and 9) are compared with the data from the compilation of recommended NIST data (columns 5 and 10) [23]. We can see that the perturbation theory method (RMBPT code) agrees better for low-excited states with [23] than the scaled multi-configuration Hartree-Fock method (Cowan code). Detailed discussion about contribution of correlation correction for B-like ions were given in Refs. [10] and [20, 21].

The excited  $2s^2 4l^2 l_J$  -  $2s^2 7l^2 l_J$ ,  $2s 2p 4l^2 4L_J$ ,  $2s 2p 5l^2 4L_J$ , and  $2p^2 4l^2 4L_J$  levels are considered in Table III. We compare energy data calculated by Cowan code (heading Cowan) and recommended data from Ref. [23]. We can see that disagreement is about 100 - 1000  $\text{cm}^{-1}$  except few levels when disagreement becomes larger for energy data. It should be noted that there are no complete set of data in Ref.[23] even for  $2s^2 7l^2 l_J$  levels, only few for levels with  $2p^2 nl^2 4L_J$  for  $n=4$ . We hope that our calculated energy can help to fill a lack of these data. The fifth and tenth columns in Table III give the weighted radiative transition probabilities summed for all lower levels under given level. Unfortunately we could not find any data for comparison. In [23] the values of radiative transition probabilities are given for some transitions but these data are not enough to obtain  $\sum(gA_r)$  for comparison with results given in Table III.

In Table IV, we present transition rates  $A_r$  ( $\text{s}^{-1}$ ) and oscillator strengths  $f$  of  $LS$ -allowed  $2s^2 2p^2 P_J$  -  $2s 2p^2 2^4 L'_J$  and  $2s 2p^2 2^4 L'_J$  -  $2p^3 2^4 L'_J$  transitions in  $O^{3+}$ . Theoretical results for  $A_r$  and  $f$  are obtained from the two codes, Cowan (columns 4 and 7) and RMBPT

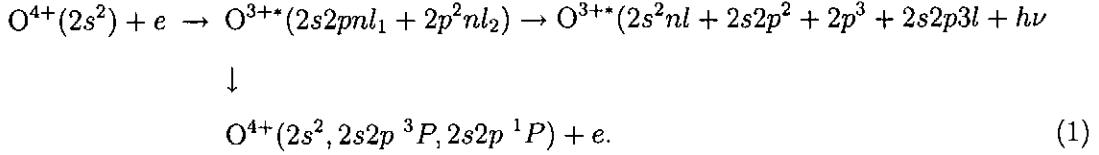

(columns 5 and 8) are compared with the data from the compilation in recommended NIST data (columns 6 and 9) [23]. Uncertainties in the recommended values given in [23] were estimated to be less than 10% based on comparisons with experimental results from lifetime and emission measurements. Our theoretical results are seen to agree between each other and with the recommended data at the 10–30% level. Since the present transition data are obtained using a single method, we hope that our calculated data for other transitions will also be reliable.

In Table V, we compare wavelengths and weighted radiative transition probabilities ( $gA_r$ ) obtained by Cowan's code with recommended NIST data [23] for  $2s^22p\ ^2P_J - 2s2p4p\ ^2L_{J'}$ ,  $2s^22p\ ^2P_J - 2s^23d\ ^2D_{J'}$ ,  $2s2p^2\ ^2L_J - 2s2p4d\ ^2L'_{J'}$ ,  $2s2p^2\ ^4P_J - 2s2p5d\ ^4P_{J'}$ , and  $2s2p3d\ ^4F_J - 2s2p4f\ ^4G_{J'}$  transitions. We find good agreements for radiative transition probabilities with largest values of  $gA_r$ . It should be noted that NIST data for  $gA_r$  are given in pure  $LS$  approximation. The deviation from  $LS$  approximation for B-like ions was discussed in detailed in Ref. [22]. It is not reasonable to use pure  $LS$  approximation especially for transition with not very large values of  $gA_r$ .

Wavelengths ( $\lambda$  in Å), weighted radiative rates ( $gA_r$  in  $s^{-1}$ ), sum of weighted radiative rates ( $\sum gA_r$  in  $s^{-1}$ ) between the  $1s^22s^2nl$ ,  $1s^22s2pnl$ , and  $1s^22p^2nl$  ( $n=2-8$ ,  $l \leq n-1$ ) states are presented in Table VIII and Table IX. As we mentioned above, autoionizing levels are considered above three thresholds  $1s^22s^2\ ^1S$ ,  $1s^22s2p\ ^3P$ ,  $1s^22s2p\ ^1P$ . In fifth column (heading  $A_a$ ) of Table VIII and Table IX are given aiutoionization rates,  $A_a$  relative to the first threshold,  $1s^22s^2\ ^1S$ . Next column in Tables VIII and IX shows aiutoionization rates as sum of  $A_a$  calculated relative to the thresholds ( $E(1s^22s^2\ ^1S) = 624382 \text{ cm}^{-1}$ ,  $E(1s^22s2p\ ^3P) = 706615 \text{ cm}^{-1}$ ,  $E(1s^22s2p\ ^1P) = 776180 \text{ cm}^{-1}$ ). The column with heading  $E_S$  in Tables VIII and IX gives excitation energies  $E_S$  relative to the first threshold  $1s^22s^2\ ^1S$  in eV.

### III. DIELECTRONIC SATELLITE SPECTRA

The DR process to bound states of B-like oxygen happens as electron capture of Be-like oxygen to doubly excited states of B-like oxygen, followed by radiative decay to the bound states of B-like oxygen. That is,

As an initial state we consider the ground state of  $\text{O}^{4+}$ ,  $2s^2$ . The  $2s2pnl_1$  and  $2p^2nl_2$  levels are taken into account as doubly excited intermediate states.

During the DR process, DR satellite lines are emitted from doubly excited autoionization states to bound states. Radiative transitions from  $2s2pnl$  states to  $2s^2nl$  states give rise to satellite lines of the  $2snp - 2s^2$  line of the Be-like oxygen. There also exist DR satellite transitions from autoionizing states  $2s2pnl$  to  $2s2pn'l'$  without changing quantum principal number  $n$ . They appear at a longer wavelength region.

The effective emission rate coefficient of the dielectronic satellite line is

$$C_S^{eff}(j, i) = 3.3 \times 10^{-24} \left( \frac{I_H}{kT_e} \right)^{3/2} \frac{Q_d(j, i)}{g_0} \exp \left( -\frac{E_S(i)}{kT_e} \right) \text{ photons cm}^3 \text{s}^{-1}, \tag{2}$$

$$Q_d(j, i) = \frac{g(i) A_a(i, i_0) A_r(j, i)}{\sum_{i'_0} A_a(i, i'_0) + \sum_k A_r(k, i)}, \tag{3}$$

where  $I_H$  is the ionization potential of hydrogen;  $j$  denotes a bound state;  $i$  a doubly excited state;  $i_0$  the initial state (which is  $2s^2$  ground state); and  $i'_0$  a possible final state for autoionization such as  $2s^2\ ^1S$  and  $2s2p\ ^3P, 2s2p\ ^1P$ . The statistical weight of the initial state  $i_0$  is  $g_0$ ;  $g(i)$  the statistical weight for a doubly excited state;  $A_a(i, i_0)$  the autoionization rate from  $i$  to  $i_0$  state;  $A_r(j, i)$  the radiative transition probability from  $i$  to  $j$  state; and  $E_S(i)$  is the excitation energy of the autoionizing state  $i$  relative to the first threshold,  $2s^2\ ^1S$ .  $T_e$  is an electron temperature and a Maxwellian distribution is assumed for electron velocities. This is an emission line intensity per electron per  $\text{O}^{4+}$  ion. For the most cases,  $A_a \gg A_r$  and then  $Q_d$  is roughly estimated as  $Q_d(j, i) \approx g(i)A_r(j, i)$ .

We already mentioned that autoionization rates ( $A_a(i, 2s^2)$ ), sum of autoionization rates ( $\sum A_a(i, i'_0) = A_a(i, 2s^2) + A_a(i, 2s2p\ ^3P) + A_a(i, 2s2p\ ^1P)$ ) and excitation energies ( $E_S$ ) for even- and odd-parity states are presented in columns 5, 6, and 7 of Tables VIII and IX. Weighted radiative rates ( $A_r(j, i)$ ), sum of weighted radiative rates ( $\sum_k A_r(k, i)$ ), and wavelengths ( $\lambda$ ) for odd-even and even-odd transitions are given in columns 8, 9, and 10 of Tables VIII and IX, respectively. Last two columns of Tables VIII and IX list relative

factor intensities  $Q_d(j, i)$  and effective emission rate coefficients ( $C_S^{eff}(j, i)$ ) define by Eq. (2). It should be noted that the number of transition listed in Tables VIII and IX is limited by including transitions with largest values of  $Q_d(j, i)$ . We include transitions with  $10^{11} > Q_d(j, i) > 10^8$  in units  $s^{-1}$ . That gives us the 571 instead of 12882 even-odd parity transitions (Table VIII) and the 652 instead of 15805 odd-even parity transitions (Table IX).

Fig. 1 shows examples of DR satellite line spectra for  $T_e = 10$  eV. In this figure, we include data for the 571 even-odd parity transitions and the 652 odd-even parity transitions presented in Tables VIII and IX. Wavelengths (in Å, column 10), effective emission rate coefficients ( $C_S^{eff}(j, i)$ ) in units of  $10^{-15} \text{ cm}^3/\text{s}$ , column 12) and Gaussian profiles with spectral resolution,  $R = \lambda/\Delta\lambda = 500$  are assumed to synthesize these spectra. Synthetic spectrum of dielectronic satellite lines from  $\text{O}^{3+}$  ion at  $T_e = 10$  eV is divided for four spectra by increasing of wavelengths:  $\lambda = 140 - 360$  Å (Fig. 1a),  $\lambda = 600 - 900$  Å (Fig. 1b),  $\lambda = 950 - 1250$  Å (Fig. 1c), and  $\lambda = 2300 - 2700$  Å (Fig. 1d). The strongest lines shown in Fig. 1a were obtained by Rydberg transitions:  $2s2p^2 - 2s2pnd$  with  $n = 4 - 8$  together with  $2s2p^2 - 2p^23p$  and  $2p^3 - 2p^23d$  transitions. There are some strong lines ( $2p^3 - 2s2pnp$ ) created by strong mixing ( $2s^22p + 2p^3$ ) configurations. Numerous number of satellite lines are  $2s^2 - 2s2p$  transitions ( $2s^2nd - 2s2pnd$ ,  $2s^2np - 2s2pnp$ , and  $2s^2nf - 2s2pnf$ ) are responsible for the spectrum shown in Fig. 1b. There are contributions of  $2s2p3p - 2s2p5d$ ,  $2s2p3d - 2s2p5p$ , and  $2s2p3p - 2p^23d$  transitions to this part of spectrum  $\text{O}^{3+}$  ion at  $T_e = 10$  eV. Detailed discussion about distribution of satellite lines are given in Ref. [11] for B-like carbon.

#### IV. DIELECTRONIC RECOMBINATION RATE COEFFICIENTS FOR EXCITED STATES

The DR rate coefficients for excited states are obtained by summation of the effective emission rate coefficients Eq. (2) of DR processes through all possible intermediate doubly excited states:

$$\alpha_d(i_0, j) = 3.3 \times 10^{-24} \left( \frac{I_H}{kT_e} \right)^{3/2} \frac{1}{g_0} \sum_i Q_d(j, i) \exp \left( -\frac{E_s(i)}{kT_e} \right), \quad (4)$$

For the DR process described by Eq. (1), we need to calculate  $\alpha_d(i_0, j)$  with  $i_0 = 2s^2$  and all possible excited states  $j$  of  $\text{O}^{3+}$  with energies below the first threshold,  $2s^2 1S$  (624382  $\text{cm}^{-1}$ ). Among  $1s^22s^2nl$ ,  $1s^22s2pnl$ , and  $1s^22p^2nl$  ( $n=2-8$ ,  $l \leq n - 1$ ) states, we found the

105 states of odd parity and the 94 states of even parity with energies less than  $624382 \text{ cm}^{-1}$ . Results of our calculations of  $\alpha_d(2s^2, j)$  for  $j$  with odd-parity states are shown in Figs. 6-9 and for  $j$  with even-parity states are shown in Figs. 10-13. Following to results for B-like carbon [11], we consider  $\alpha_d(2s^2, j)$  as function of electron temperature  $T_e$  from  $T_e=0.1 \text{ eV}$  up to  $T_e=0.1 \text{ eV}=120 \text{ eV}$ .

As can be seen from Figs. 6 - 13, the curves can be divided by three different groups. There are some curves without any maximum, as curves described  $\alpha_d(2s^2, j)$  for  $j = 2p^2(^3P)3p\ ^4D_J$  (Fig. 7),  $j = 2s2p(^3P)3d\ ^4F_J, \ ^4D_J$  (Fig. 8),  $j = 2s2p(^3P)4d\ ^4F_J, \ ^4D_J$  (Fig. 9),  $j = 2s2p(^3P)3p\ ^2S_{1/2}, \ ^2P_J, \ ^2D_J$  (Fig. 11),  $j = 2s2p(^3P)4p\ ^2S_{1/2}, \ ^2P_J, \ ^2D_J, \ 2p^23s$  (Fig. 12). There are curves with two maximums (about  $0.2 - 1 \text{ eV}$  and  $6 - 10 \text{ eV}$ ), as curves described  $\alpha_d(2s^2, j)$  for  $j = 2s^2np\ ^2P_J, 2s^2nf\ ^2F_J$  (Fig. 6) and  $2s^2nd\ ^2D_J, 2s^2ng\ ^2G_J$  (Fig. 10). The most of curves are with one maximum around  $1 \text{ eV}$ . Tabulated data of  $\alpha_d(2s^2, j)$  for 28 points of electron temperature  $120\text{eV}>T_e>0\text{eV}$  are presented by Table X (105 states of odd parity) and Table XI (94 states of even parity).

In order to estimate contributions from autoionizing states with high  $n$  levels to the DR rate coefficients for excited states (sum over  $i$  in Eq. (4)), we use empirical scaling laws [11, 17]. Only one-electron  $2s - np$ ,  $2p - ns$ , and  $2p - nd$  dipole transitions are possible to include by using those extrapolation. Additional contributions from high- $n$  states we found for the first low-lying states,  $2s^22p$ ,  $2s2p^2$ , and  $2p^3$ . For these states we need to consider  $2s^22p - 2s2pns$ ,  $2s2p^2 - 2s2pns$ ,  $2s2p^2 - 2s2pnd$ ,  $2s2p^2 - 2p^2np$ ,  $2p^3 - 2p^2ns$ , and  $2p^3 - 2p^2ns$  transitions for  $n > 8$ .

To estimate  $Q_d(j, i)$  in Eq.(2) for autoionization states  $i$  with high principal quantum number  $n$  for  $2s2pnl$  and  $2p^2nl$  states and for  $2s - np$  and  $2p - nl$  dipole transitions we used our calculated data for  $n = 7$  and  $1/n^3$  scaling law for  $A_a$  and  $A_r$ .

$$A_a(2s2p(^{1,3}P)nl\ ^{-2,4}L_J) = \left(\frac{7}{n}\right)^3 A_a(2s2p(^{1,3}P)7l\ ^{-2,4}L_J) \quad (5)$$

$$\begin{aligned} & A_r(2s^2(^1S)2p\ ^2P_J - 2s2p(^{1,3}P)nl\ ^{-2,4}L_J) \\ &= \left(\frac{7}{n}\right)^3 A_r(2s^2(^1S)2p\ ^2P_J - 2s2p(^{1,3}P)7l\ ^{-2,4}L_J) \left(\frac{E(2s^2(^1S)2p\ ^2P_J - 2s2p(^{1,3}P)nl\ ^{-2,4}L_J)}{E(2s^2(^1S)2p\ ^2P_J - 2s2p(^{1,3}P)7l\ ^{-2,4}L_J)}\right)^3 \end{aligned} \quad (6)$$

An asymptotic formula was proposed in paper [24] in order to obtain energies for  $2s2p(^3P)nl$  and  $2s2p(^1P)nl$  states as a function of  $nl$  as follows. We obtain for energies

counted from the threshold:

$$E(2s2p(^{1,3}P)nl) - E(2s2p(^{1,3}P)) = -\frac{1}{2n^2} \left( Z - 4 + \frac{2.211}{n} \right)^2 \quad (7)$$

and for energy transitions between two states in Eq. (6)

$$\begin{aligned} & E(2s^2(^1S)2p^2P_J - 2s2p(^{1,3}P)nl^{2,4}L_J) \\ &= E(2s^2(^1S)2p^2P_J - 2s2p(^{1,3}P)7l^{2,4}L_J) - 8 \left( \frac{1}{n^2} - \frac{1}{7^2} \right) \times 219474 \text{ cm}^{-1}. \end{aligned} \quad (8)$$

Similar formula was used for excitation energies  $E_S(i)$  in Eq. (4) when  $i=2s2p(^{1,3}P)nl$

$$E_S(2s2p(^{1,3}P)nl^{2,4}L_J) = E_S(2s2p(^{1,3}P)7l^{2,4}L_J) - 8 \left( \frac{1}{n^2} - \frac{1}{7^2} \right) \times 27.21 \text{ eV}. \quad (9)$$

Using these scaling formulas for  $A_a(2s2p(^{1,3}P)nl^{2,4}L_J)$ ,  $A_r(2s^2(^1S)2p^2P_J - 2s2p(^{1,3}P)nl^{2,4}L_J)$ , we calculated  $Q_d(2s^2(^1S)2p^2P_J - 2s2p(^{1,3}P)nl^{2,4}L_J)$  as function of  $n$  and then using Eq. (9) for  $E_S$ , we calculate sums over  $n$  for  $\alpha_d(2s^2, 2s^22p^2P_J)$  as function of  $n$  and  $T_e$ .

Results of our calculations are illustrated by Fig. 2. We use for scaling our data calculated for  $n=7$  to reproduce our data for  $n = 8$  in order to check our scaling law. We found that difference between calculated and scaling data is about 10 % except some cases when mixing of configuration is very important. In Fig. 2, we demonstrate contribution of scaling data from  $n = 9$  up to  $n = 10$  (2), from  $n = 9$  up to  $n = 100$  (3), and from  $n = 9$  up to  $n = 30000$  (4). As can be seen from Fig. 2, there are no difference between results calculated up to  $n = 100$  and  $n = 30000$ . The second conclusion derived from Fig. 2 is an importance of high states for  $T_e > 1$  eV. For low electron temperature, low-lying states are important,  $2p^23s$  and  $2p^23d$ . Contribution of these states are shown in Fig. 2 by comparison curves describing  $\alpha_d(2s^2, 2s^22p^2P_J)$  for  $n = 4 - 8$  (1) and for  $n = 3 - 30000$  (5). Tabulated results contributions of high- $n$  states (from  $n = 9$  up to  $n=30000$ ) for  $\alpha_d(2s^2, 2s^22p^2P_J)$  are given by two columns of Table VI.

Similar data are presented in Table VI for DR rate coefficients,  $\alpha_d(2s^2, 2s2p^2{}^4P_J)$ ,  $\alpha_d(2s^2, 2s2p^2{}^2D_J)$ ,  $\alpha_d(2s^2, 2s2p^2{}^2S_{1/2})$ , and  $\alpha_d(2s^2, 2s2p^2{}^2P_J)$ . It was already mentioned that for  $2s2p^2$  states, we need to consider  $2s2p^2 - 2s2pns$ ,  $2s2p^2 - 2s2pnd$ , and  $2s2p^2 - 2p^2ns$  transitions. The most important for  $\alpha_d(2s^2, 2s2p^2{}^4P_J)$  is the first one,  $2s2p^2 - 2s2pns$  transition and the second one,  $2s2p^2 - 2s2pnd$  transition for  $\alpha_d(2s^2, 2s2p^2{}^2D_J)$  (contribution of  $2s2p^2 - 2s2pnd$  transitions is larger than contribution of  $2s2p^2 - 2s2pns$  transitions by factor

5). In both cases, contribution of  $2s2p^2 - 2p^2np$  transitions is smaller than two other by factor 10 - 50. Sum of these three contributions are given in Table VI for  $\alpha_d$  of the eight states  $2s2p^2$  configuration. We calculate also high- $n$  contribution for DR rate coefficients,  $\alpha_d(2s^2, 2p^3 {}^4S_{3/2})$ ,  $\alpha_d(2s^2, 2p^3 {}^2D_J)$ , and  $\alpha_d(2s^2, 2p^3 {}^2P_J)$ . For  $2p^3$  states, the  $2p^3 - 2p^2ns$  and  $2p^3 - 2p^2nd$  transitions are important, but the high- $n$  contribution from these transitions is less than 1% from data given in Table X for  $2p^3$  states and they are do not be included in Table VI.

## V. TOTAL DIELECTRONIC RECOMBINATION RATE COEFFICIENTS

The total DR rate coefficients are obtained by summation of the rate coefficients of DR processes through all possible intermediate single and doubly excited states:

$$\alpha_d(i_0) = 3.3 \times 10^{-24} \left( \frac{I_H}{kT_e} \right)^{3/2} \frac{1}{g_0} \sum_i \sum_j Q_d(j, i) \exp \left( -\frac{E_s(i)}{kT_e} \right), \quad (10)$$

We already discuss contribution from doubly excited states with high  $n$  levels to the DR rate coefficients for excited states (sum over  $i$  in Eq. (4)). For total DR rate coefficients we need to consider also the contribution from single excited states with high  $n$ ,  $2s^2nl$  states. For these states,  $2s^2nl - 2s2pnl$  transitions are most important (see, Refs. [11, 14–17]).

To estimate  $Q_d(j, i)$  in Eq. (3) for  $j = 2s^2nl$  and  $i = 2s2pnl$  for  $n > 8$ , we used our calculated data for  $n = 7$  and  $1/n^3$  scaling law for  $A_a$  (Eq. (5)) and  $E_S$  (Eq. (9)). The values of  $A_r$  for  $2s^2nl - 2s2pnl$  transitions are almost constant as function of  $n$  since this is one-electron  $2s - 2p$  transition. We need to take into account the change of energy difference following Eq. (7).

$$\begin{aligned} & A_r (2s^2({}^1S)nl^2l_J - 2s2p({}^{1,3}P)nl^2{}^4L_J) \\ &= A_r (2s^2({}^1S)7l^2l_J - 2s2p({}^{1,3}P)7l^2{}^4L_J) \left( \frac{E(2s^2({}^1S)nl^2P_J) - E(2s^2({}^1S)nl^2l_J)}{E(2s^2({}^1S)7l^2l_J) - E(2s2p({}^{1,3}P)7l^2{}^4L_J)} \right)^3 \end{aligned} \quad (11)$$

Using asymptotic formula given by Eq. (8) that gives us in first approximation:

$$E(2s^2({}^1S)nl^2l_J - 2s2p({}^{1,3}P)nl^2{}^4L_J) = E(2s^2({}^1S)7l^2l_J - 2s2p({}^{1,3}P)7l^2{}^4L_J) \quad (12)$$

and finally we obtain [11]

$$A \left( 2s^2(^1S)nl^2l_J - 2s2p(^{1,3}P)nl^2L_J \right) = A \left( 2s^2(^1S)7l^2l_J - 2s2p(^{1,3}P)7l^2L_J \right). \quad (13)$$

To estimate  $Q_d(j, i)$  in Eq.(3) for autoionization states  $i$  with high principal quantum number  $n$  for  $2s^2nl - 2s2pnl$  (with  $l = 0 - 6$ ) dipole transitions we used our calculated data for  $n = 7$  and  $1/n^3$  scaling law for  $A_a$ . We also consider  $2s^2nk - 2s2pnk$  transitions with  $l=7$ . For this case, we start scaling from  $n=8$ .

Using these scaling formulas for  $A_a(2s2p(^{1,3}P)nl^2L_J)$ ,  $A_r(2s^2(^1S)nl^2l_J - 2s2p(^{1,3}P)nl^2L_J)$ , we calculated  $Q_d(2s^2(^1S)nl^2l_J - 2s2p(^{1,3}P)nl^2L_J)$  and then using Eq. (9) for  $E_S$ , we calculate  $C_S^{\text{eff}}(2s^2(^1S)nl^2l_J - 2s2p(^{1,3}P)nl^2L_J)$ . Sums over  $LSJ$  and intermediate momentums  $^{1,3}P$  for  $C_S^{\text{eff}}(2s^2(^1S)nl^2l_J - 2s2p(^{1,3}P)nl^2L_J)$  give us data for expression of  $C_S^{\text{eff}}(2s^2nl - 2s2pnl)$  as function of  $nl$  and  $T_e$ .

Results of our calculations for  $C_S^{\text{eff}}(2s^2nl - 2s2pnl)$  are illustrated by Fig. 3 for  $2s^2ns - 2s2pns$ ,  $2s^2np - 2s2pnp$ ,  $2s^2ng - 2s2png$ , and  $2s^2nh - 2s2pnh$  transitions. Additionally, we calculate also  $C_S^{\text{eff}}(2s^2nl - 2s2pnl)$  for  $2s^2nd - 2s2pnd$ ,  $2s^2nf - 2s2pnf$ ,  $2s^2ni - 2s2pni$ , and  $2s^2nk - 2s2pnk$  transitions. We use for scaling our data calculated for  $n=7$  and to check our scaling law to reproduce our data for  $n = 8$ . We found that difference between calculated and scaling data is about 10 % except some cases when mixing of configuration is very important. In Fig. 3, we demonstrate contribution of scaling data from  $n = 9$  up to  $n = 10$  (curve "2"), from  $n = 9$  up to  $n = 100$  (curve "3"), from  $n = 9$  up to  $n = 1000$  (curve "4"), and from  $n = 9$  up to  $n = 30000$  (curve "5"). As can be seen from Fig. 3, there are no difference between results calculated up to  $n = 1000$  and  $n = 30000$ . It should be noted that the convergency of  $2s^2nl - 2s2pnl$  transitions is more slowly than for  $2s^2p - 2s2pnp$  transitions considered in previous section. We also present in Fig. 3 result of summing calculated data of  $C_S^{\text{eff}}(2s^2nl - 2s2pnl)$  from  $nl = 5s, 4p, 5g, 6h$  up to  $nl = 8s, 8p, 8g, 8h$ , respectively. As can be seen from Fig. 3, the curve "1" describing those data is above curves "2" - "5" describing scaling data only for low electron temperature  $T_e$ . For  $T_e > 1\text{eV}$ , the curve "1" is between the curves "2" ( $n = 9-10$ ) and the curve "3" describing contribution from scaling data from  $n = 9$  up to  $n = 100$ . We already mentioned previously that the importance of the contributions of highly excited state for DR rate coefficients was underlined by Hahn [13] and confirmed by results in Refs. [11, 14-17].

Final result of our  $2s^2nl - 2s2pnl$  scaling is shown by Fig. 4. In this figure, we present

$\sum_{n=9}^{n=30000} C_S^{eff}(2s^2nl - 2s2pnl)$  as function of  $l$  and electron temperature  $T_e$ . As can be seen from Fig. 4, the value of  $\sum_{n=9}^{n=30000} C_S^{eff}(2s^2nl - 2s2pnl)$  is increased with increasing  $l$  up to  $l = 5$  and becomes smaller for  $l = 6, 7$  than for  $l = 2$  and 4.

Sum of scaling data from  $n = 9 - 30000$  and sum of calculated results from  $n = 2 - 8$  (see Tables X and XI) are illustrated by Fig. 5. It can be seen from this figure that contribution of DR rates for excited states is responsible for total DR rate coefficient for low electron temperature but contribution of high- $n$  excited states becomes more important with increasing  $T_e$ . The curve describing contribution of these states has maximum in region of  $T_e$  around 10 eV. Resulting curve for total DR rate coefficient  $\alpha_d(2s^2)$  has two maximums in region of  $T_e$  around 1 eV and 10 eV. Our results are compared in Fig. 5 with results presented by Badnell in Ref. [6]. As can be seen from this figure the value of  $\alpha_d(2s^2)$  from [6] is almost represent only our scaling data.

Tabulated data ( $\alpha_d^{tot} = \alpha_d^a + \alpha_d^b + \alpha_d^c$ ) are given in Table VII. Contributions of  $\alpha_d^a$  and  $\alpha_d^c$  are sum from excited states with  $n=2-8$  and  $n=9-30000$ , respectively. Contribution of  $\alpha_d^b$  is from scaling of the  $2s^2nl - 2s2pnl$  transitions from  $n=9$  up to  $n = 30000$ . In Table VII, the values of  $\alpha_d^a$ ,  $\alpha_d^b$ ,  $\alpha_d^c$ , and  $\alpha_d^{tot}$  are presented as function of electron temperature  $T_e$  from 0.1 eV up to 1264.6 eV.

## VI. CONCLUSION

We calculated the state selective DR rate coefficients from the ground state of Be-like O ion to the bound states of B-like O ion in this paper. The total DR rate coefficient is in good agreement with previous work by Badnell in Ref. [6].

Energy levels, wavelengths, weighted radiative transition probabilities, and autoionization rates were calculated for B-like oxygen ion with two theoretical methods, and multi-configurational Hartree-Fock method (Cowan's code) and for limited number of states relativistic many-body perturbation theory (RMBPT). Calculated atomic data are used to obtain the dielectronic satellite lines as well as the DR rate coefficients.

We take into account doubly excited states  $2s2pnl$  and  $2p^2nl$  ( $n \geq 8, l \leq 7$ ) as intermediate resonance states with  $n$  up to 30000 to calculate the DR rate coefficients.

Most of state selective DR rate coefficients show double peaks as a function of electron temperature. The transitions through intermediate states  $2s2pnl$  make a peak in the rate

coefficients at  $T \sim 2\text{-}10$  eV.

Configuration mixing [ $2s^2nl + 2p^2nl$ ] plays an important role for the DR rate coefficients of  $2s^2nl$  levels with  $n \leq 8$  at low temperature.

The state selective rate coefficients can be used in a collisional-radiative model for investigating population kinetics and plasma diagnostics for recombining plasma. We will calculate spectral line intensities of B-like O ions by a collisional-radiative model with the DR rate coefficients obtained in this paper to compare with measurements of laboratory plasmas in elsewhere.

Table VII: Total DR rate coefficients ( $\alpha_d^{\text{tot}}$  in  $\text{cm}^3/\text{s}$ ):  $\alpha_d^{\text{tot}} = \alpha_d^a + \alpha_d^b + \alpha_d^c$  as function of electron temperature ( $T_e$  in eV) for B-like oxygen. Contributions of  $\alpha_d^a$  and  $\alpha_d^c$  are sum from excited states with  $n=2\text{-}8$  and  $n=9\text{-}30000$ , respectively. Contribution of  $\alpha_d^b$  is from scaling of the  $2s^2nl - 2s2pnl$  transitions from  $n=9$  up to  $n = 30000$ .

Table VIII: Autoionization rates ( $A_a$  in  $s^{-1}$ ) and excitation energies ( $E_S$  in eV) for even-parity states. Wavelengths ( $\lambda$  in Å), weighted radiative rates ( $gA_r$  in  $s^{-1}$ ), factor intensities ( $Q_d$  in  $s^{-1}$ ) and effective emission rate coefficients ( $C_S^{\text{eff}}$  in  $\text{cm}^3/\text{s}$ ) for transitions between odd- and even-parity states of B-like oxygen.

Table IX: Autoionization rates ( $A_a$  in  $s^{-1}$ ) and excitation energies ( $E_S$  in eV) for odd-parity states. Wavelengths ( $\lambda$  in Å), weighted radiative rates ( $gA_r$  in  $s^{-1}$ ), factor intensities ( $Q_d$  in  $s^{-1}$ ) and effective emission rate coefficients ( $C_S^{\text{eff}}$  in  $\text{cm}^3/\text{s}$ ) for transitions between even- and odd-parity states of B-like oxygen.

## Recent Issues of NIFS-DATA Series

- NIFS-DATA-60 U.I. Safronova, C. Namba, W.R. Johnson, M.S. Safronova,  
Relativistic Many-Body Calculations of Energies for  $n = 3$  States in Aluminumlike Ions: Jan. 2001
- NIFS-DATA-61 U.I. Safronova, C. Namba, I. Murakami, W.R. Johnson and M.S. Safronova,  
E1,E2, M1, and M2 Transitions in the Neon Isoelectronic Sequence: Jan. 2001
- NIFS-DATA-62 R. K. Janev, Yu.V. Ralchenko, T. Kenmotsu,  
Unified Analytic Formula for Physical Sputtering Yield at Normal Ion Incidence: Apr. 2001
- NIFS-DATA-63 Y. Itikawa,  
Bibliography on Electron Collisions with Molecules: Rotational and Vibrational Excitations, 1980-2000 Apr. 2001
- NIFS-DATA-64 R.K. Janev, J.G. Wang and T.Kato,  
Cross Sections and Rate Coefficients for Charge Exchange Reactions of Protons with Hydrocarbon Molecules: May 2001
- NIFS-DATA-65 T. Kenmotsu, Y. Yamamura, T. Ono and T. Kawamura,  
A New Formula of the Energy Spectrum of Sputtered Atoms from a Target Material Bombarded with Light Ions at Normal Incidence: May 2001
- NIFS-DATA-66 I. Murakami, U. I. Safronova and T. Kato,  
Dielectronic Recombination Rate Coefficients to Excited States of Be-like Oxygen: May 2001
- NIFS-DATA-67 N. Matsunami, E. Hatanaka, J. Kondoh, H. Hosaka, K. Tsumori, H. Sakaue and H. Tawara,  
Secondary Charged Particle Emission from Proton Conductive Oxides by Ion Impact; July 2001
- NIFS-DATA-68 R.K. Janev, J.G. Wang, I. Murakami and T. Kato,  
Cross Sections and Rate Coefficients for Electron-Impact Ionization of Hydrocarbon Molecules: Oct. 2001
- NIFS-DATA-69 S. Zou, T. Kato, I. Murakami,  
Charge Exchange Recombination Spectroscopy of Li III Ions for Fusion Plasma Diagnostics: Oct. 2001
- NIFS-DATA-70 I. Murakami, T. Kato, A. Igarashi, M. Imai, Y. Itikawa, D. Kato, M. Kimura, T. Kusakabe, K. Moribayashi, T. Morishita, K. Motohashi, L. Pichl  
AMDIS and CHART update (I): Oct. 2002
- NIFS-DATA-71 S. Zou, L. Pichl, M. Kimura and T. Kato  
Total, Partial and Differential Ionization Cross Sections in Proton-hydrogen Collisions at Low Energy: Jan. 2003
- NIFS-DATA-72 M. Hayashi  
Bibliography of Electron and Photon Cross Sections with Atoms and Molecules Published in the 20th Century – Argon –: Jan. 2003
- NIFS-DATA-73 J. Horacek, K. Houfek, M. Cizek, I. Murakami and T. Kato  
Rate Coefficients for Low-Energy Electron Dissociative Attachment to Molecular Hydrogen: Feb. 2003
- NIFS-DATA-74 M. Hayashi  
Bibliography of Electron and Photon Cross Sections with Atoms and Molecules Published in the 20th Century – Carbon Dioxide –: Apr. 2003
- NIFS-DATA-75 X. Ma, H.P. Liu, Z.H. Yang, Y.D. Wang, X.M. Chen, Z.Y. Liu, I. Murakami and C. Namba  
Cross-section Data Measured at Low Impact Energies for Ar<sup>q+</sup> Ions on Argon and Neon Targets. Apr. 2003
- NIFS-DATA-76 M. Hayashi  
Bibliography of Electron and Photon Cross Sections with Atoms and Molecules Published in the 20th Century – Sulphur Hexafluoride –: May 2003
- NIFS-DATA-77 M. Hayashi  
Bibliography of Electron and Photon Cross Sections with Atoms and Molecules Published in the 20th Century – Nitrogen Molecule – : June 2003
- NIFS-DATA-78 A. Iwamae, T. Fujimoto, H. Zhang, D. P. Kilcrease, G. Csanak and K.A. Berrington  
Population Alignment Collisional Radiative Model for Helium-like Carbon:Polarization of Emission Lines and Anisotropy of the Electron Velocity Distribution Function in Plasmas: Aug. 2003
- NIFS-DATA-79 M. Hayashi  
Bibliography of Electron and Photon Cross Sections with Atoms and Molecules Published in the 20th Century – Xenon – : Sep. 2003
- NIFS-DATA-80 M. Hayashi  
Bibliography of Electron and Photon Cross Sections with Atoms and Molecules Published in the 20th Century – Halogen Molecules – : Dec. 2003
- NIFS-DATA-81 M. Hayashi  
Bibliography of Electron and Photon Cross Sections with Atoms and Molecules Published in the 20th Century – Water vapour – : Dec. 2003
- NIFS-DATA-82 M. Hayashi  
Bibliography of Electron and Photon Cross Sections with Atoms and Molecules Published in the 20th Century – Hydrogen molecules – : Feb. 2004
- NIFS-DATA-83 M. Hayashi  
Bibliography of Electron and Photon Cross Sections with Atoms and Molecules Published in the 20th Century – Hydrogen Halide Molecules – : Mar. 2004
- NIFS-DATA-84 ELECTRAN - Monte Carlo Program of Secondary Electron Emission from Monoatomic Solids under the Impact of 0.1 - 10 keV Electrons: Mar. 2004
- NIFS-DATA-85 I. Murakami, T. Kato, U.I. Safronova and A.A. Vasilyev,  
Dielectronic Recombination Rate Coefficients to Excited States of Boronlike Oxygen and Dielectronic Satellite Lines: May 2004
