

§16. Experimental Study on Liquid Lithium Flow for IFMIF Target

Horiike, H., Kondo, H., Yamaoka, N., Miyamoto, S., Kanemura, T., Niwa, Y., Amano, K., Yoshikawa, T., Sugiura, Y. (Osaka Univ.), Ida, M., Nakamura, H., Ara, K. (Japan Atomic Energy Agency), Suzuki, A. (Univ. Tokyo), Nagasaka, T., Kondo, M., Muroga, T.

In the International Fusion Materials Irradiation Facility (IFMIF), a liquid Li plane jet of 25 mm in depth, and 260 mm in width, with a flow velocity of 10 to 20 m/s is considered as the beam target. A key technology is liquid Li flow technology in an open channel for the design of the stable target system, and for liquid Li fusion blanket.

In the present program, experiments on a liquid lithium flow for the target flow were performed with using the lithium circulation facility in Osaka University. And as the results, many outcomes were obtained, such as successful measurement of free-surface fluctuation and surface-wave velocity, in the joint research of the LHD Project Research Collaboration between Osaka University, University of Tokyo, Tohoku University, JAEA, and NIFS^{1), 2), 3)}.

In the present report, activities conducted between April 2008 and March 2009 are summarized. In FY 2008, main activities are focused on presentations and publications of our achievements since budget was only planned for traveling expenses.

Table.1 summarizes presentations and publications including domestic meetings and conference, workshops, international conferences, proceedings and papers in FY 2008. Contents of the presentation and papers mainly focused on the measurement of the surface fluctuations and the surface-wave velocity.

Owing to various fruitful discussions at the conferences and to the peer-review processes, positive comments for improvement of the diagnostics were addressed. The authors were greatly appreciate for them, and would like to reflect them to future works of diagnostic system design, for the IFMIF-EVEDA Li loop.

Future works which remain to be solved other than those above are to develop diagnostics applicable to the actual target flow in the IFMIF. Under the IFMIF condition, diagnostics must be radiation-resistant and non-contact methods from a standpoint of continuous monitoring of the dynamic behavior of the lithium target. Thus, development of diagnostics available in the IFMIF is a crucial task.

Acknowledgement

Authors would like to express their gratitude to NIFS and Prof. H. Matsui of Tohoku University for a great deal of cooperation and support.
